HUMANITARIAN CARBON CALCULATOR

ESTIMATE YOUR ORGANIZATION'S
GREENHOUSE GAS EMISSIONS!

The Humanitarian Carbon Calculator (HCC) was developed under the umbrella of the Sustainable Supply Chain Alliance led by the ICRC, to allow organizations to assess the direct and indirect greenhouse gas emissions associated with their activities.

The development of the tool was informed by consultations with **over 100 humanitarian organizations**, experts, and ECHO throughout 2021. These consultations helped define a methodology for estimating an organization's greenhouse gas emissions following the international standard of the GHG Protocol.

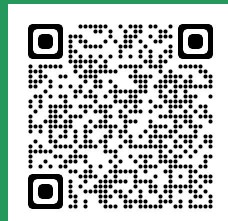

Assessing the direct and indirect greenhouse gas emissions allows **to set reduction targets and to build emission reduction plans**. The Humanitarian Carbon Calculator can also be used to monitor the evolution of an organization's emissions over time!

This tool and the associated resources will be regularly reviewed and improved with the support of all humanitarian organizations. So far, they have been **piloted by 10 organizations with different sizes and mandates**, and two surveys have been developed to gather more emissions factors and improve the methodology over time.

ACCESS THE TOOL HERE!

RESOURCES AVAILABLE:

- **User manual** – Please read me before using the tools
- **Launch presentation January 2023**
- **The Aggregation tool** – organizations with over 30 individual entities, offices,
- **Training videos**, guidance and a first list of emissions reduction levers
